# Section I: Background

✤ Search Destination

In the ever-evolving landscape of the aviation sector, the importance of prioritizing customer satisfaction stands as the basis for success. With customers forming the bedrock of this industry, airlines rely greatly on their patronage. It is, therefore, crucial for organizations to delve deeply into the preferences and desires of their clientele, striving to deliver not just satisfactory but exceptional and tailored experiences. Deploying initiatives such as post-service emails and personalized interactions is one avenue to achieve this goal, fostering a sense of value among customers.

A notable illustration of this customer-centric approach is exemplified by Emirates through their "Knowledge-driven Inflight Service." By empowering their crew to analyze the travel history of customers with the airline, Emirates seeks to enhance the potential for a more personalized and enriching experience for each passenger.

The aviation industry is characterized by intense competition and demands a strategic focus on customer satisfaction, which serves as an important metric for evaluating business performance. The International Air Transport Association (IATA) reports a consistent annual increase of approximately 7% in the number of airline passengers since 2015. Despite this growth, the net profit per airline passenger has witnessed a concerning decline – plummeting from \$10 in 2015 to an estimated \$7.4 in 2018, with successive decreases to \$9 in 2016 and 2017. This decline is primarily attributed to the intense competition within the industry and the recent surge in operational costs faced by airlines. Navigating this challenging landscape requires a renewed commitment to understanding and meeting customer expectations to ensure sustainable success in the aviation sector.

## Background

# Section II: The Business Problem

✤ Search Destination

#### **Business Problem:**

How can airlines improve customer satisfaction?

#### **Problem Statement:**

In the fiercely competitive airline industry facing declining profits and escalating operational costs, the critical challenge is to identify and enhance key aspects of customer satisfaction needed to attract and retain passengers.

#### Analyze:

By exploring the dataset encompassing attributes like cleanliness, seat comfort, service, and overall flight experience, we aim to analyze customer feedback to discern patterns and identify factors significantly impacting satisfaction levels.

#### **Predict:**

Utilizing advanced predictive modeling, our objective is to forecast future customer satisfaction, enabling airlines to proactively address potential pain points and strategically allocate resources to areas with the most substantial impact on overall passenger contentment.

#### **Assessment:**

Through a comprehensive assessment of the dataset, we seek to not only uncover the primary drivers of customer satisfaction but also provide actionable insights for airlines to emphasize and improve specific aspects of their services, ultimately fostering a more satisfying and personalized flight experience for passengers.

Dataset: https://www.kaggle.com/code/frixinglife/airline-passenger-satisfaction-part-1

## **The Business Problem**

# Section III: Project Objectives

✤ Search Destination

Conduct an in-depth examination of the dataset, focusing on parameters such as cleanliness, comfort, service, and overall flight experience.

Dissect customer feedback to discern patterns and identify the key factors significantly impacting satisfaction levels.

Utilize advanced predictive modeling techniques to forecast future customer satisfaction, enabling proactive issue resolution and resource allocation.

Provide actionable insights for airlines to strategically allocate resources, emphasizing areas with the most substantial impact on overall passenger contentment.

Offer a comprehensive assessment of the dataset to uncover primary drivers of customer satisfaction, guiding airlines to emphasize and improve specific aspects of their services.

## **Project Objectives**

#### **Comprehensive Analysis of Customer Feedback:**

#### **Identification of Satisfaction Drivers:**

#### **Advanced Predictive Modeling:**

#### **Strategic Resource Allocation:**

#### **Enhancement of Specific Service Aspects:**

# Section IV: Primary Goal & Business Impact

✤ Search Destination

## **Primary Goal And Business Impact**

### **Primary Goal: Enhancing Customer Satisfaction**

Our project's primary aim is to assist airline businesses in enhancing customer satisfaction. We aim to achieve this by deciphering the elements that resonate with customers, including factors such as cleanliness, comfort, service, and the overall flight experience.

#### **Business Impact: Strategic Insights for Improved Satisfaction**

Through the application of predictive modeling on the dataset, our goal extends beyond merely anticipating future customer satisfaction. We aspire to provide actionable and strategic insights to guide airlines on precisely which aspects of their services to emphasize. By fostering an environment that strategically addresses these key factors, our project aims to contribute to increased satisfaction among passengers, ultimately benefiting the business as a whole.

# Section V: Project Implications

✤ Search Destination

Enhanced Customer Loyalty and Retention: Successful insights implementation leads to increased loyalty and retention. a positive brand image, enhancing the airline's reputation. **Competitive Advantage:** Proactive satisfaction improvement provides a competitive edge in the market. **Revenue Growth:** Satisfied customers result in word-of-mouth recommendations, driving revenue. **Operational Efficiency:** Focused improvements may optimize resources, reducing costs while maintaining service quality. **Regulatory Compliance:** Aligning with customer expectations enhances compliance and fosters positive regulatory relationships. Long-Term Sustainability: Adapting to customer preferences ensures long-term sustainability and industry relevance.

## **Project Implications**

- **Positive Brand Image and Reputation:** Improved satisfaction contributes to

# Section VII: Data Gathering

✤ Search Destination

## **Data Gathering: Understanding Passenger Satisfaction**

- The dataset comprises diverse information collected
- from an anonymous airline's website.
- It includes parameters such as cleanliness, comfort,
- service quality, and overall flight experience.
- The data is sourced from a collection mechanism
- implemented by the airline.
- Insights are drawn from post-flight surveys, feedback
- forms, and customer reviews.

The dataset spans a significant number of observations

Each row represents a unique passenger experience with

## **Data Gathering: Understanding Passenger Satisfaction**

- ✓ The dataset incorporates a mix of numerical and

  - Numerical variables include flight distance, delay times,
  - Categorical variables encompass gender, customer type,
  - travel type, and satisfaction levels.
  - Prior to analysis, missing values were addressed through
  - The dataset is now complete, ensuring the reliability of

- The dataset may include temporal elements, such as
- flight schedules and delays.
- Temporal trends will be considered for a comprehensive
- analysis of passenger satisfaction over time.

## **Data Gathering: Understanding Passenger Satisfaction**

This comprehensive overview provides insight into the dataset's origin, source, scope, types, quality, temporal considerations, ethical aspects, exploration, and preparation for the subsequent phases of the project.

- Passenger data is anonymized to respect privacy.
- Consent procedures were followed during data collection
- to adhere to ethical standards.

Initial exploratory data analysis (EDA) involved understanding the distribution of variables and

- Imputation techniques were applied to handle missing
- values for both numerical and categorical variables.
- The dataset is now prepared for advanced analytics and

Arrival Delay in Minutes	25976.0	14.693756	37.466787	0.0	0.00	0.0	13.00	1115.0

These descriptive statistics provide a summary of the main characteristics of

✓ **Unnamed: 0**: Index or identifier | Count: Entries in the dataset | Mean: Average index value | Std: Measures variation | Min/Max: Range of index

id: Likely another identifier | Count, mean, std, min, max provide similar

✓ Age: Count: Observations for age | Mean: Average age | Std: Spread or dispersion | Min/Max: Range of ages.

Flight Distance: Represents flight distances | Descriptive stats: Mean, std, min, 25%, 50%, 75%, max.

✓ Inflight wifi service to Cleanliness: Ratings for flight aspects | Mean, std, min, 25%, 50%, 75%, max provide distribution insights.

Departure Delay in Minutes & Arrival Delay in Minutes: Variables

represent delays | Descriptive stats: Mean, std, min, 25%, 50%, 75%, max

Overall, the descriptive statistics give a sense of the central tendency, spread, and shape of the distribution for each variable. For example:

✓ The average age of passengers is around 39.62 years, with a standard

✓ The average flight distance is approximately 1193.79 miles, with a standard deviation of 998.68.

Ratings for various aspects of the flight experience (e.g., Inflight wifi service, Seat comfort, Cleanliness) range from 0 to 5, with means and standard deviations providing insights into the variability of ratings.

## **Passenger Satisfaction Overview**

- Not Satisfied: 56.7%
- **Pie Chart Insights:** ✓ **Satisfied**: 43.3%

### **Observations:**

- ✓ The pie chart visualizes passenger satisfaction levels.
- dissatisfaction.

### Key Takeaway:

Note: Data sourced from the presented pie chart.

- ✓ A majority, comprising 56.7%, express neutrality or
- ✓ The remaining 43.3% of passengers indicate
  - satisfaction with their experience.

- ✓ A notable portion of passengers presents an
  - opportunity for improvement in overall satisfaction.

## **Insights From Variable Correlations**

#### **Correlation Matrix Calculation:**

The correlation heatmap is a valuable tool for identifying patterns and relationships between variables, helping to understand the structure of the dataset and guide further analysis.

Correlation of 1.0:: A perfect positive correlation means that as one variable increases, the other variable increases proportionally. In the case of "On-board Service" and "Satisfaction" having a correlation of 1.0, it suggests that as the on-board service rating increases, the satisfaction rating also increases in a perfectly linear manner.

Visual Representation in Heatmap: In a correlation heatmap, a perfect positive correlation is often represented by a cell colored in a way that indicates a strong positive correlation, such as a dark shade or a warmer color.

**Implications:** The perfect positive correlation between "On-board Service" and "Satisfaction" suggests that passengers who rate the on-board service higher are very likely to also rate their overall satisfaction higher, and vice versa.

**Considerations:** While a perfect positive correlation indicates a strong linear relationship, it doesn't necessarily imply causation. Other factors or variables could contribute to the satisfaction rating, and further analysis may be needed to understand the underlying reasons for the observed correlation.

In practical terms, if you find a correlation of 1.0 between two variables, it's worth investigating the relationship more deeply and understanding the context to derive meaningful insights from the data.

Depi

Customer

Departure/

## **Relationship Between Departure And Arrival Delays**

#### **Observations:**

- The observed scatter plot reveals a noticeable
  - alignment of points along a nearly straight line,
  - extending from the lower left corner to the upper
  - right. This implies that, to some extent, the
  - relationship between arrival time delay and
  - departure time delay can be approximated as linear.

### **Logical Interpretation:**

- when the departure of the airline's customers is delayed by a specific amount of time, a corresponding delay of approximately the same duration can be expected upon landing. This assumption is based on the premise that the aircraft does not employ accelerated flight to compensate for the time lost during departure.

Note: Data sourced from the presented scatterplot.

## **Customer Profile Overview**

**Data Visualization** 

Note: Data sourced from the presented pie charts.

#### **Customer Satisfaction:**

- ✓ Pie chart displaying customer satisfaction levels.
- satisfaction.

#### **Customer Loyalty:**

- Pie chart illustrating the distribution of customer loyalty.  $\checkmark$
- Observation: 81.5% are loyal customers, and 18.5% are not loyal.

#### **Preferred Class:**

- Pie chart depicting the percentage of customers in each travel class (Eco  $\checkmark$ Plus, Business, Eco).
- Observation: Eco Plus 7.4%, Business 48.1%, Eco 44.5%.

#### **Gender Distribution:**

- Pie chart showcasing the proportion of male and female customers.  $\checkmark$
- Observation: Female customers constitute 50.7%, while male customers make up 49.3%.

#### **Type of Travel:**

- travel).
- Observation: Personal travel accounts for 30.6%, while business travel represents 69.4%.

Observation: 56.7% of customers are not satisfied, while 43.3% express

✓ Pie chart indicating the breakdown of travel types (Personal travel, Business

**Key Insight:** This comprehensive overview provides a snapshot of the customer profile, highlighting satisfaction levels, loyalty, travel class preferences, gender distribution, and the purpose of travel. Understanding these aspects is crucial for tailoring services to meet diverse customer needs and preferences.

#### **Top 25 Features Contributing to Customer Satisfaction:**

- Horizontal bar chart displaying the feature importance.  $\checkmark$
- Features are ranked based on their contribution to overall customer satisfaction.  $\checkmark$

#### **Observation:**

#### **Key Insight:**

Understanding and prioritizing factors that significantly impact customer satisfaction, such as the online boarding experience, can guide strategic improvements and enhance the overall quality of the customer journey.

## **Feature Importance**

✓ According to the model, the online boarding experience emerges as the highest contributor to overall customer satisfaction.

## **KNN Classification ROC Curve Analysis**

#### Area Under the Curve (AUC):

- - negative instances.

#### **Performance Interpretation:**

- classes.

#### **Decision Threshold Consideration:**

- thresholds.
- specificity).

#### **Comparative Analysis:**

benchmarking.

#### **Model Confidence:**

binary classification tasks.

✓ AUC = 0.96 indicates strong discrimination between positive and

✓ High AUC reflects the model's exceptional ability to distinguish

Closer proximity to 1.0 signifies robust overall performance.

✓ ROC Curve reveals performance variations across different decision

Optimize the threshold based on specific needs (e.g., sensitivity,

✓ Compare AUC values with other models for performance

High AUC indicates the KNN model's confidence in predictions.

Reliable tool for binary classification.

Key Takeaway: The KNN classification model demonstrates exceptional discrimination ability with an AUC of 0.96, making it a reliable choice for

## **Random Forest Classification ROC Curve Analysis**

### Area Under the Curve (AUC):

- - and negative instances.

#### **Performance Interpretation:**

- to distinguish classes.

#### **Decision Threshold Consideration:**

- thresholds.
- specificity).

#### **Comparative Analysis:**

benchmarking.

#### **Model Confidence:**

- predictions.

✓ AUC = 0.97 signifies outstanding discrimination between positive

✓ High AUC indicates the Random Forest model's exceptional ability

Closer proximity to 1.0 reflects robust overall performance.

ROC Curve reveals performance variations across different decision

Optimize the threshold based on specific needs (e.g., sensitivity,

Compare AUC values with other models for performance

High AUC indicates the Random Forest model confidence in

Reliable and powerful tool for binary classification.

Key Insight: The Random Forest classification model demonstrates outstanding discrimination ability with an AUC of 0.97, making it a robust and reliable choice for binary classification tasks.

## **Decision Tree Classification ROC Curve Analysis**

#### Area Under the Curve (AUC):

- - negative instances.

#### **Performance Interpretation:**

- distinguish classes.

#### **Comparative Analysis:**

benchmarking.

#### **Model Confidence:**

- predictions.

✓ AUC = 0.95 indicates strong discrimination between positive and

✓ High AUC reflects the Decision Tree model's strong ability to

Closer proximity to 1.0 signifies robust overall performance.

✓ Compare AUC values with other models for performance

High AUC indicates the Decision Tree model's confidence in

Reliable and effective tool for binary classification.

Key Insight: The Decision Tree classification model exhibits strong discrimination ability with an AUC of 0.95, making it a reliable choice for binary classification tasks. Consider decision threshold optimization for specific needs. In comparative analysis, it stands out as a robust solution, instilling confidence in its predictive capabilities.

## **Logistic Regression ROC Curve Analysis**

![](_page_30_Figure_2.jpeg)

#### Area Under the Curve (AUC):

- - negative instances.

#### **Performance Interpretation:**

- distinguish classes.

#### **Comparative Analysis:**

benchmarking.

#### **Model Confidence:**

- predictions.

✓ AUC = 0.93 indicates strong discrimination between positive and

✓ High AUC reflects the Logistic Regression model's solid ability to

Closer proximity to 1.0 signifies robust overall performance.

✓ Compare AUC values with other models for performance

High AUC indicates the Logistic Regression model confidence in

Reliable and effective tool for binary classification.

**Key Insight:** The Logistic Regression classification model demonstrates strong discrimination ability with an AUC of 0.93. Consider decision threshold optimization for specific needs. In comparative analysis, it stands as a reliable solution, instilling confidence in its predictive capabilities for binary classification tasks.

![](_page_31_Picture_0.jpeg)

![](_page_31_Picture_1.jpeg)

#### **Balanced Sensitivity and Specificity:**

- instances.

### **Holistic Evaluation:**

	accuracy	sensitivity	<pre>specificity</pre>
K-NN	0.921432	0.928669	0.914095
Random Forest	0.91 <mark>742</mark> 9	0.929805	0.904883
Decision Trees	0.938472	0.941845	0.935053
Logistic Regression	0.868024	0.880055	0.855827

## **Model Performance Comparison**

### **Decision Trees Outperform:**

✓ Accuracy: Decision Trees lead with 93.84%, showcasing the model's overall correctness in predictions.

✓ **Sensitivity:** Decision Trees exhibit high sensitivity (94.07%), crucial for correctly identifying positive

Specificity: With 93.60%, Decision Trees maintain a strong ability to correctly identify negative instances.

#### **Consideration for Trade-offs:**

Decision Trees strike a balance between sensitivity and specificity, making it versatile for various application needs.

Decision Trees demonstrate superior performance across all measured metrics, making them the preferred model for this classification task.

![](_page_34_Picture_1.jpeg)

#### **Advanced Predictive Models:**

#### **Dynamic Preferences Analysis:**

#### **Technology Integration Strategies:**

![](_page_34_Picture_15.jpeg)

## **Future Study Implications**

 Enhance forecasting accuracy through exploration of additional variables and methodologies.

Investigate the evolving impact of dynamic

customer preferences on satisfaction over time.

#### **Cross-Industry Insights:**

 Conduct comparative studies to identify universal satisfaction drivers and industry-specific nuances within aviation.

Explore the integration of emerging technologies like AI and ML to refine predictive models and elevate the overall customer experience.

This concise roadmap guides future studies, focusing on crucial areas to continuously enhance the airline industry and elevate customer satisfaction.

![](_page_35_Picture_0.jpeg)

![](_page_35_Picture_1.jpeg)

Our comprehensive analysis underscores the importance of prioritizing enhancements to online boarding and inflight entertainment experiences. To achieve this, we recommend conducting customer surveys to discern preferences and tailoring offerings accordingly. Emphasizing cost-effective improvements ensures practicality and sustainability, while dynamic customer engagement strategies, personalized interactions, and regular monitoring of trends contribute to an elevated and evolving passenger experience. Collaboration with crew members for enhanced service delivery and continuous refinement of predictive models using emerging technologies will position airlines to not only address immediate satisfaction concerns but also thrive in the ever-evolving aviation landscape.

## **Final Recommendations**

![](_page_36_Picture_0.jpeg)

## Conclusion

### **Answering the Business Problem**

Our analysis reveals pivotal insights for the airline industry to strategically enhance customer satisfaction. Identifying key factors like online boarding, inflight entertainment, and inflight wifi service, we guide airlines in prioritizing customer-centric improvements. Emphasizing cost-effective enhancements and personalized experiences, our recommendations offer actionable strategies for boosting overall satisfaction, addressing financial challenges, and fostering sustained success in the dynamic aviation sector.

Through our strategic analysis and insights, we've taken significant strides toward achieving the goal of enhancing airline satisfaction. By identifying and addressing key factors, we pave the way for a more satisfying and personalized flight experience. Our approach empowers airlines to proactively navigate industry challenges, fostering sustained success in a competitive landscape.

### **Advantages of Our Solution**

Our solution stands out for its data-driven precision, holistic approach, proactive insights, strategic resource allocation, dynamic adaptability, cost-effectiveness, and tailored customer engagement, offering a more effective and nuanced approach to enhancing airline customer satisfaction.

## **Did We Achieve Our Goal?**

# Section XI: Obstacles Faced & Improvements

✤ Search Destination

![](_page_37_Picture_4.jpeg)

![](_page_38_Picture_0.jpeg)

## **Obstacles Faced And Improvements**

- Our analysis faced limitations due to the absence of data about external circumstances. For example, we could not ascertain whether the delay in departure was caused by factors like adverse weather conditions or whether flight turbulence contributed to a negative passenger experience?
  - Expanding the dataset to include additional variables would have enhanced our ability to explore the relationship between passenger satisfaction and their experiences.
  - This dataset possesses substantial potential to serve as a robust
    business analytics tool. Even though the data size and quality was
    at a satisfactory level, future analysis could focus on isolating
    specific factors for each airline since the services differ from airline
    to airline.

# Section XII: Lessons Learned

![](_page_39_Picture_2.jpeg)

![](_page_39_Picture_4.jpeg)

![](_page_40_Picture_0.jpeg)

### Data Quality is Paramount: Emphasizing the critical role of high-quality data, rigorous cleaning and validation processes are essential for accurate insights.

K Holistic Approach Yields Richer Insights: Taking a holistic approach to consider a wide range of variables provides a nuanced understanding of customer satisfaction, revealing hidden patterns and interdependencies.

Balancing Predictive Modeling and Interpretability: Striking a balance between sophisticated predictive models and interpretability is crucial for practical decision-making and implementation.

Continuous Adaptation to Industry Dynamics: Recognizing the dynamic nature of the aviation industry, regular updates to models and strategies are necessary to stay relevant in a competitive landscape.
